

WB-12R/331R/363R is a receiver capable of handling 12/31/63 standard 24V valves. The valve is wired into the WB-3XXR but still is controlled by a controller in a remote location.

WB-3XXR receiver replaces the controller that is removed. The new controller is larger to handle all of the valves. There is no programming required, the system is ready for use immediately out of the box.

The radio operates on a 900MHz ISM band and is free to use. The kit comes with an external antenna, mounting hardware and RF cable.
